Lightroom Lightroom is Adobe's latest photo management tool, which provides advanced editing capabilities and high-end viewing features, as well as excellent management features. Lightroom is currently available only for the Mac version. In addition to the standard tools that other image software provides, Lightroom allows you to edit RAW files in-camera. It includes powerful built-in editing tools that enable the user to apply a variety of special effects to images, including selective color and tone alterations, color corrections, and image sharpening. You can even process the images using RAW processing tools, which can be set to a variety of options in the Picture Controls to allow you to alter the camera's settings. The latest version of Lightroom, 4.1, is now available for both Windows and Mac computers. If you're looking for a one-stop solution for managing your images, you really need to consider Lightroom. It is a full-featured software package with extensive editing, management, cataloging, and organizing capabilities. ## Chapter 13: Keeping Your Photos Organized As your photo collection grows, it may become difficult to keep all of your photos in one place. If you have photos strewn across your hard drive, you're likely to forget a photo in the process of trying to find it. You may not have a central place where you can keep your photos organized. Even if you do have a central location, your photos may not be alphabetized, put into subfolders by subject, or cataloged by photo number. Fortunately, your photos don't need to become buried in a collection of hard-copy photos in a pile on your desktop. Although computers are useful tools, an organized collection of photos can also be very helpful. If

Q: Sharing data between an application running in full screen and a secondary Windows 10 UWP application I'm building an application that shows data in a very small window at the bottom of the screen. If the user interacts with the data, the application switches to full screen, while leaving the bottom window showing. Now, the problem is that the data shared between the two windows remains unchanged when the application is in full screen. How can I share data between the two windows? For example, if the user is in the map and zooms in to get a closer view of the map, and the user changes the value of a search parameter in the top window, how can I get this change to propagate to the bottom window? I know I can solve it with a pair of WinRT APIs or even WinJS APIs, but that will not be an optimal solution, as the application is targeted for .NET/C#. I would like to use the .NET/C# APIs, but not at the cost of making the application more complex. I'm using WinJS for the top window and WinRT for the bottom window. EDIT: As the question was less clear, here is an example. Assume that the user is in the Maps app, and that they are zooming in. Now, if the user clicks on a pin on the map, a new window opens, while the map window stays in its current position. The user changes something in that second window, and I want the first window to update.

A: `Windows.ApplicationModel.AppWindows` is a collection of app windows that can communicate. When you close the full-screen application, you can call `ApplicationData.Roaming.RoamingSettings.TryGetValue` with the name of your application. From there, you can either use `ApplicationData.Roaming.RoamingSettings.ContainsKey` to test for the existence of the key, or use the `TryGetValue` to update the value, or both. You will need to write a function to keep track of the window instance, as your application's task might change when you go full screen. The complete function might look something like this:

```
public string GetCurrentSetting(string key) { var settings = Windows.ApplicationModel.AppWindows.AppWindow.FromName("MyAwesomeAppName"); var result = settings.TryGetValue(key, out string value);
```
